

SmartResearch : A5 Marketing Video Script

Slide 1 : Hook + Product Introduction

Research is more accessible than ever, but managing it has become harder. Students and researchers now deal with large numbers of papers, PDFs, notes and online sources across different platforms.

Instead of spending most of their time analysing ideas, they often lose time organising files, searching for key points and trying to keep track of what they have already read.

SmartResearch is an AI-assisted research management platform designed to make this process easier. It helps users upload, organise, summarise and discover research through one centralised workflow, turning scattered academic material into structured and usable knowledge.

Slide 2 : The Problem

Traditional research workflows are often fragmented. Papers may be saved across folders, citation tools, browser tabs and note-taking apps, which makes important information difficult to find later.

Literature reviews can also take weeks of manual reading, summarising and comparing sources. When research material is poorly organised, users can miss useful insights, repeat the same work, or struggle to identify links between papers.

This creates information overload. The problem is not just having too much research available, but having no efficient way to manage, search and understand it.

SmartResearch was designed to solve this by bringing research organisation, summarisation and discovery into one platform.

Slide 3A : How it works

SmartResearch allows users to upload research papers directly into the platform through a simple interface.

Once uploaded, each document is processed and stored in a centralised paper management dashboard. The system extracts key metadata such as the paper title, authors and publication details, helping users keep their research library organised.

SmartResearch also generates intelligent summaries for each paper. These summaries help users quickly understand the main ideas, arguments and findings before deciding which papers need deeper reading.

This saves time during the early stages of research, especially when users need to review large numbers of sources.

Slide 3B : How it works

SmartResearch also supports research discovery through semantic search and intelligent clustering.

Semantic search allows users to search by meaning, not just exact keywords. This helps users find relevant information even when different papers use different wording.

The clustering feature groups similar papers based on related topics, themes and research areas. This helps users identify patterns, compare ideas and organise literature reviews more effectively.

Users can also generate exportable summaries and reports, making it easier to move from research collection to writing and analysis.

Slide 4A : Target Users

SmartResearch is designed for students, researchers and academic teams.

University students can use it to organise weekly readings, prepare assignments and complete literature reviews more efficiently.

Researchers can use it to manage larger collections of papers across multiple projects, while academic teams can benefit from keeping research materials, summaries and reports in one shared structure.

The platform is especially useful for users who need to work with many sources at once and want a clearer way to move from reading to analysis.

Slide 4B : Competitive Advantage

Many existing research tools focus on only one part of the research process.

Zotero and Mendeley are useful for citation and reference management, while tools like Elicit, ResearchRabbit and Litmaps focus more on AI search, evidence discovery or literature mapping.

SmartResearch combines these functions into one platform. It supports paper management, AI-generated summaries, semantic search, clustering and exportable reports in a single workflow.

This gives SmartResearch a clearer advantage for users who want to manage research from upload to analysis without switching between multiple tools.

Slide 5 : Marketing Strategy

SmartResearch would be marketed as an accessible and practical academic tool for students, researchers and academic teams.

Because it is web-based, users can access it from anywhere without complex installation.

The platform could be promoted through university networks, student communities, academic groups and short tutorial videos showing how users can upload papers, generate summaries, search their library and export reports.

The main message is simple: SmartResearch helps users spend less time managing papers and more time understanding research.

Slide 6 : Future Vision + Closing

SmartResearch represents a step toward smarter academic workflows.

Future improvements could include stronger recommendation systems, deeper AI-powered insights and better collaboration tools for research teams.

The long-term goal is to create a platform that does more than store research papers. SmartResearch aims to help users understand their research landscape, identify meaningful connections and work more efficiently with complex academic information.

By reducing manual work and making research easier to organise, SmartResearch helps students and researchers focus on knowledge, analysis and discovery.
